EROAD's FTC Solution allows you to collect, manage and compile the right data to accurately complete, and maximise, your FTC claim.

EROAD

1 — EROAD's GPS tracking hardware is installed in your fleet vehicles.

2 — If the vehicle has any auxiliary equipment, this is connected directly to the Ehubo (up to 3 connections possible.

3 — An electronic GPS trail is then created for every vehicle via EROAD's tracking hardware unit. Data on the vehicle's performance, activity and location is recorded and classified as either being on a public road or off-road.

4 — EROAD's FTC Solution also records other activity such as a vehicle's ignition being turned on or off, idling and auxiliary equipment being operated off-road.

5 — The one web-based interface EROAD's 'Depot' allows for easy analysis and custom zones to be created in the system to define on-road and off-road areas for claims. For instance, a construction site on a main road can be 'geofenced' as an off-road worksite in order to claim the maximum FTC entitlement.

6 — Fuel consumption rates are set up based on engine diagnostics, manufacturers specifications or sampling for idling and auxiliary equipment usage.

7 — Fuel transactions are easily uploaded in the Depot via CSV bulk upload.

8 — All data for the reporting period are compiled into an easy-to-read report for EROAD's FTC Solution.

9 — All data and fuel transactions are securely stored in EROAD's Depot system alongside an archived record of the claim per reporting period.

10 — Data can then be easily uploaded to your office financial systems

11 — Collect the maximum monthly FTC rebate you deserve!
